

MAR 27 2008

Application No.: 10/628,229Docket No.: 30019297-2 US (1509-426)**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions and listings of claims in the application:

**Listing of Claims:**

1. (previously presented) A method of viewing visual pictorial media across a network comprising the steps of:
  - i) storing respective local visual pictorial media data corresponding to the same visual pictorial media on first and second network elements connected to the network;
  - ii) creating derived visual pictorial media data from the locally stored visual pictorial media data with a processing means of the first network element;
  - iii) automatically generating a control data set representing the derived visual pictorial data and corresponding to operations to be performed by a processing means to create the derived visual pictorial media data;
  - iv) transmitting the control data set from the first network element to the second network element via the network;
  - v) recreating the derived visual pictorial data with a processing means of the second network element by use of the control data set; and
  - vi) displaying the local visual pictorial media data in accordance with the derived visual pictorial media data upon viewing means of the second network element.
2. (previously presented) A method according to claim 1 in which the step of creating the derived visual pictorial media is performed automatically.
3. (previously presented) A method as claimed in claim 1, wherein the step of creating the derived visual pictorial data comprises selecting a portion of the locally stored visual pictorial media data corresponding to a portion of the visual pictorial media.

Application No.: 10/628,229Docket No.: 30019297-2 US (1509-426)

4. (previously presented) The method of claim 3 further comprising displaying the portion of the locally stored visual pictorial media upon viewing means of the first network element substantially synchronously with the displaying of step (vi).
5. (previously presented) A method according to claim 1 in which the visual pictorial media data stored on the first and second elements are identical.
6. (previously presented) The method of claim 1 comprising using visual pictorial saliency techniques to select the portion of the visual pictorial media automatically.
7. (previously presented) The method of claim 1 comprising including in the automatically generated control data set a spatial and temporal locational information detailing a sub-set of video visual pictorial media.
8. (original) The method of claim 1 comprising sharing a rostrum path between the first and second network elements.
9. (previously presented) The method of claim 1 comprising transferring visual pictorial media data from the first network element to the second network element prior to step (i).
10. (previously presented) The method of claim 1 further comprising:
  - i) creating further derived visual pictorial media data from the locally stored visual pictorial media data with a processing means of the second network element;
  - ii) automatically generating a control data set representing the further derived visual pictorial data and corresponding to operations to be performed by a processing means to create the derived visual pictorial media data;
  - iii) transmitting the control data set from the second network element to the first network element via the network; and

Application No.: 10/628,229Docket No.: 30019297-2 US (1509-426)

v) recreating the further derived visual pictorial data with a processing means of the first network element by use of the control data set.

11. (currently amended) A visual pictorial media viewing system comprising first and second network elements connected over a network; the first network element being arranged for: (a) storing visual pictorial media data, (b) automatically selecting a portion of the visual pictorial media data, (c) processing said portion of the visual pictorial media data, (d) generating a control data set, and (e) transmitting the control data set to the second network element over the network;

the second network element being arranged for: (a) receiving the control data set from the first network element, (b) storing a copy of the visual pictorial media data, (c) processing the received and the visual pictorial media data, and (d) displaying a pictorial image corresponding to the processed visual pictorial media data; the control data set including (a) information relating to the location of said portion within the locally stored copy of the visual pictorial media data and (b) processing instructions relating to generating and displaying the pictorial image generated from said portion on the display of the second network element arranged for displaying the pictorial image corresponding to the processed visual pictorial media data.

12. (previously presented) A visual media viewing system according to claim 11 wherein the control data set is smaller than the portion of the visual pictorial media data.

13. (previously presented) A visual media viewing system according to claim 11 wherein the first network element has a display for displaying the pictorial image generated from the portion of the visual pictorial media data synchronously with its display upon the display of the second network element.

14. (previously presented) A visual media viewing system according to claim 11 further including a third network element connected to the network, including viewing means and a data store arranged to store said visual pictorial media locally, and the first

Application No.: 10/628,229Docket No.: 30019297-2 US (1509-426)

network element is arranged to transmit the control data set to the third network element such that said viewing means is arranged to substantially synchronously display (a) the portion of the visual pictorial media that are stored locally, with (b) the display of the portion of the visual pictorial media upon the second network element.

15. (previously presented) A network element comprising a data store for storing visual pictorial media data, a selector for automatically selecting derived visual pictorial media data from the stored visual pictorial media data, a first processor for processing said derived visual pictorial media data, a data generator for generating a control data set, and a transmitter for transmitting the control data set across a network to a remote network element having a local copy of the visual pictorial media data stored thereupon, wherein the control data set includes information corresponding to operations to be performed by a second processor to create the derived visual pictorial media data to enable the second processor, in response to receiving the control data set, to recreate the derived visual pictorial data for display of the local visual pictorial media data in accordance with the derived visual pictorial media data.

16. (previously presented) A network element as claimed in claim 15, wherein the information contained in the control data set comprises information relating to the location of a portion within the visual pictorial media data and processing instructions relating to generating and displaying a pictorial image corresponding to said portion of the visual media data from the local copy of the visual media stored [[upon]] on the remote network element.

17. (previously presented) A network element according to claim 15 wherein the network element comprises a viewer for viewing an automatically selected portion of the visual pictorial media data synchronously with the display of the pictorial image upon the remote network element.

18. (previously presented) A network element according to claim 15 wherein the

Application No.: 10/628,229Docket No.: 30019297-2 US (1509-426)

selector is arranged to automatically select a portion of the visual pictorial media data in response to a user selection of a region of a pictorial image formed from the visual pictorial media data.

19. (previously presented) A network element according to claim 15 wherein the selector is arranged to select, automatically, a portion of the visual pictorial media using a visual saliency technique.

20. (previously presented) A network element according to claim 15 wherein the control data set includes details of transitions between a plurality of automatically selected portions of visual pictorial media.

21. (previously presented) A network element according to claim 15 wherein the selector is arranged to select the portion of the data in response to a prompt from a remote network element.

22. (currently amended) A network element comprising  
a receiver for receiving a control data set from a remote network element across a network,  
a data store for locally storing visual pictorial media data,  
a display for displaying an image stored in the data store,  
the received control data set including (a) information relating to the location in the data store of a portion of the visual pictorial media data and (b) processing instructions relating to the generation and display of a pictorial image of said portion from the locally stored visual pictorial media data upon the display, and  
a processor coupled with the receiver, data store and display for supplying a portion of the locally stored visual pictorial media data to the display based on the location information and the processing instruction in the received control data set.  
~~a processor for processing the received control data set and the visual pictorial media data and a display for displaying an image corresponding to the processed visual~~

Application No.: 10/628,229Docket No.: 30019297-2 US (1509-426)

pictorial media data;

~~a received control data set including (a) information relating to the location of an automatically selected portion of the visual pictorial media data and (b) processing instructions relating to the generation and display of a pictorial image of said portion from the locally stored visual pictorial media data upon the display.~~

23. (currently amended) A network element according to claim 22 wherein the control data set includes processing instructions relating to displaying the pictorial image on the network element synchronously with displaying ~~[[the]]~~a pictorial image on the remote network element, the pictorial image on the remote network element being the same as the locally stored visual media data.

24. (previously presented) A program storage device readable by a machine encoding a program of instructions which when operated upon the machine causes the machine to operate as a network element according to claim 15.

25. (currently amended) A ~~personal computer~~network element comprising a data store for storing visual pictorial media data, ~~an image~~a processor for ~~(a) automatically selecting a portion of the visual pictorial media data, a central processor for and (b) generating a control data set including the location of said portion within the visual pictorial media data and information relating to the processing of the data by the image processor,~~ a network interface card for transmitting the control data set, over a network, to a second ~~personal computer~~network element having a locally stored copy of the visual pictorial media data thereon and a screen for synchronously displaying (a) a pictorial image corresponding to the portion of the data with (b) the second personal computer.

26. (currently amended) A ~~personal computer~~network element comprising a network interface card for receiving a control data set from a remote ~~personal computer~~network element across a network, a data storage device for locally storing visual pictorial media

Application No.: 10/628,229Docket No.: 30019297-2 US (1509-426)

data, a processor for processing the received control data set and the visual pictorial media data, and a screen for displaying a pictorial image corresponding to the processed visual pictorial media data, the received control data set including (a) information relating to location of an automatically selected portion of the visual pictorial media data and (b) processing instructions relating to generating and synchronously displaying (a) a pictorial image of said portion from the locally stored visual pictorial media data upon the screen with (b) its display on the remote personal computer network element, the processor being coupled with the network interface card, the screen, the data storage device and the display for causing the screen to automatically display the local selected portion of the visual pictorial media data, synchronously with display of the locally stored visual pictorial media data with display thereof at the remote network element.
